Yeah, ADP has a lot of trouble with full schema name, especially when it's not dbo by default (ie, you are not part of the owner database role (dbo)). Also, it has the very bad habit of adding the current user as the schema name to many calls to the SQL-Server. For example, if your user name is MyName and you want to call the stored procedure dbo.MyProcedure, it will often call MyName.MyProcedure instead, making it impossible to find dbo.MyProcedure.

On forms, you can set the Record Source Qualifier and for control, you can add the schema name to the Row Source but it's probably a better idea to always use dbo and set everyone to dbo when you want to use ADP against a SQL-Server.

Access ADPs do not seem to reckonize full schema name i.e.
dbo.mytable.
?
