Thanks for that. Interesting. I went and opened an ADP and everything seemed to be working just fine including creating a new table. However, when I went into the connection box, it listed my server but in the drop down list it was not listed – in fact when I dropped the list it automatically attached '\SQLEXPRESS' to my server name. My databases were no longer available and the connection failed. So I removed '\SQLEXPRESS' and everything worked fine again. As far as I know there is only SQL Server 8 on my machine now so I went into Program Files\Microsoft SQL Server to see what is there. There are 2 folders, one called MSSQL and the other called MSSQL.1. My databases are in the MSSQL\Data folder along with master and model and so forth. The new stuff (incuding master and model, etc.) is in the MSSQL.1\MSSQL\Data folder. What would you think be the conclusion to draw from this ?

Since you are talking Access ADP and ASP web application:

1. Access ADP is merely front end app and IDE for SQL Server, and it is desktop technology (forget data page, it is gone in Access2007 anyway), so different from web app (ASP or ASP.NET), you cannot "convert" onw to the

Re: Adp to asp web page

other, unless "converting" means complete re-write.

2. ASP is old technology and different from ASP.NET. With Visual Studio Web Express2005, you can only develop ASP.NET, not ASP.

3. Sql Server Express is a database server, (SQL Server 2005), and can be used with ASP, ASP.NET, Access APD (though, you cannot design table, view, SP and UDF with Access2003 and older on SQL Server2005/Express, you need upcomming Access2007 for that) and other apps...

I caught on to this after I posted and downloaded Express 2005 Visula Web Developer and Express 2005 SQL Server. Is this the latest software and the accepted way of doing this now ? Also while on the subject what are the substantive changes between Access 2002 XP and 2007 (if any) ?

If the Order Form in the adp project is not Data Page (I doubt it is), then the simplest way is, well, forget the adp at all and do it ASP way. Oh, you may re-use or copy the query the form is based on in your ASP project (view, SP, or dynamic SQL). Even it is data page, it may still better to do the ASP page without bothering to convert it, and data page has been dropped from Access2007's ADP support.

What is the simplest and most efficient way to recreate the NorthwindCS.adp Orders form (with the detail subform) as a .asp (I assume) web page ?
