Try this Barry...

```
Dim oCmd As Command, param As Parameter
Dim cn As New ADODB.Connection, sqlString As String
```

```
sqlString = "YourStoredProc"
Set oCmd = New ADODB.Command
Set cn = CurrentProject.Connection
Set oCmd.ActiveConnection = cn
oCmd.CommandText = sqlString
oCmd.CommandType = adCmdStoredProc
oCmd.CommandTimeout = 15
```

```
oCmd.Execute , , adExecuteNoRecords
cn.close
set cn = nothing
```

hth.. bob

I am new to sqlServer and am doing an application front end using Access 2003 and the backend sqlServerExpress 2005.

When I run a very simple Stored Procedure on a table called 'MiscCharges' such as;

```
SET NOCOUNT ON
UPDATE MiscCharges SET Description='New Description'
WHERE Joborder='1000'
```

I get the following message: "the procedure executed successfully but did not return records"

This happens regardless of how I run the SP. Either in the SP window or from

Re: the procedure executed successfully but did not return records

VBA code.

I don't get this message with a simple SELECT sql statement.

What am I doing wrong?
