it's funny you should say that.

I think that DAP is probably the most important, mission critical component that Microsoft has ever delivered.

They embed 'Office Web Components' in about 20 other products.

I believe that we should all stand in unison, BEGGING Microsoft to change OWC to openSource instead of just killing it.

It's by far the most beautiful web-based spreadsheet that I've ever seen in my whole life.

It can do Olap Reporting— it's just a fantastic fucking product.

These parameters look OK. However, a lot of potential problems could block the connection even if the parameters are OK; like a firewall for example..

The first thing to check would be to remove any blank space after each « ; » (don't remember if it's important or not); the second would be to specify the protocol to be used as well as the port (often but not necessarily 14330 by adding the name of the library (network) or one of the prefix tcp: or np: ; for example:

ODBC:

```
Driver={SQL Server}; Server=jack8.db.2965895.hostedresource.com;  
Database=jack8; Uid=jack8; Pwd='your password';Network=DBMSSOCN
```

ODBC:

```
Driver={SQL Server}; Server=jack8.db.2965895.hostedresource.com,1433;  
Database=jack8; Uid=jack8; Pwd='your password';Network=DBMSSOCN
```

Re: data acces page connect to sql server

OLE DB, OleDbConnection (.NET):

Provider=sqloledb; Data Source=tcp:jack8.db.2965895.hostedresource.com;

Initial

Catalog=jack8; User ID=jack8; Password='your password';

OLE DB, OleDbConnection (.NET):

Provider=sqloledb; Data Source=tcp:jack8.db.2965895.hostedresource.com,1433;

Initial

Catalog=jack8; User ID=jack8; Password='your password';

Using an Alias (see SQL–Server Client Network Utility or something like that, depends of the version of SQL–Server used on your local machine) will often solve some of these connection problems. A fourth thing to try would be to connect using another program such as Enterprise Manager or SQL–Server Management Studio to see if there is anything wrong with the setup of your Data Access Page. You also don't say if you're able to connection to any other SQL–Server like an instance on your local machine. Trying to ping the address could also be a good idea.

If the SQL–Server is not the default instance but a named instance, then you must add the name of the instance after the address of the server (but before the port number). However, as these parameters have been given to you; I don't think that's your problem here. Finally, you can take a look at the following articles to help you troubleshooting connection problem:

Hi, i cannot figure out the address host name when i want to connect my data acces page to the microsoft OLE DB PROvider for sql server so that i can link (in data link properties) my data access page to the sql server. The following address I was given are

ODBC:

Driver={SQL Server}; Server=jack8.db.2965895.hostedresource.com;

Re: data acces page connect to sql server

Database=jack8; Uid=jack8; Pwd='your password';

OLE DB, OleDbConnection (.NET):

Provider=sqloledb; Data Source=jack8.db.2965895.hostedresource.com;

Initial

Catalog=jack8; User ID=jack8; Password='your password';

SqlConnection (.NET):

Data Source=jack8.db.2965895.hostedresource.com; Initial Catalog=jack8;

User

ID=jack8; Password='your password';

Thxs.

Confused: Is this the right way to display my drop down combo box in the data access page by linking the data access page to sql server? Or is there more correct way?

The correct way is not to use Data Access Pages anymore. This technology is practically dead and is a lost of time. While there are more or less easy to start up with at the beginning; later, they become practically impossible to use/develop when you want to do anything more advanced than a simple basic form. Believe me, I know from personal experience. They're also subject to the main problem of modern security: they're usually blocked by any intervening firewall and deblocking the firewall to let them go through – when you have the permission to do so – is puncturing a big hole into it.

In my opinion, you should stop trying to use this old stuff and switch to something like ASP.NET.

Thxs. Jack

Happy New Year 2009!
