Yes, you can set it to work with RDS; as stated in my previous message and yours (and in other previous posts in this newsgroup).

However, RDS has now been deprecated by Microsoft some years ago because of security concerns and I wish you good luck to find a public hosting service who has not removed this thing or who will accept to give you access to it. But if you find one or if you are using a private web site, then yes you can set it up.

BTW, at this point, the journey with DAPs will not get easier or faster thereafter but that's another story.
