Hi,

I have a MS access database into which I need to import a text file that is oriented vertically (fields are listed from top to bottom with the value for each field appearing to the right of the field name (with a "|" as a delimiter)). The text file will only have 1 record's data. I would ideally like to setup a linked table to import this data – does anyone know of a way I can setup this import?

Any help that can be provided would be greatly appreciated.

Best wishes,

George Hadley
