I have 2 x copies of same access 2003 database, one is Master database copy and other is Backup copy. By mistake we have entered data into the backup copy with latest records. Now we would like to update the original copy of database with the data entered into the backup copy of the database.

We tried to use "REPLICATION" option from tools menu but this asks to make a replica database first from the main database. Can we use existing backup database as a "Replica" database and the master copy as "Design Master" database? If not the is there any way to update the latest changes from the backup database to the master copy?

.
