On your form, I entered a new doc called "Test." (All I did was enter the word "Test.")

Then I clicked on Test, hoping to see the Windows File Open/Save dialog appear, where I would have browsed to a certain .doc (MS Word) file on my hard drive and selected it, thereby establishing the link.

I sense that the double click event never had a chance to execute, because the moment I click on the word "Test" it begins the search for an http:// reference and opens the browser. (Would changing the field type from hyperlink to text resolve this?)

Kurt
