

Formatting Problem on Printing Form

I have an Access form that has some intermittent formatting problems when printed. When printed, any bitmaps on the form come out poorly, i.e. the bitmaps are missing or very pixely and the lines on the form look thicker in some places or offset in others. In addition any checkboxes don't show up on the form. This only happens on two particular printers and interestingly the formatting is different depending on whether the "File", "Print" menu is used or the "print current record" command button is used. Since this happens only on certain printers I believe it's related to the printers, but why the does the difference in printing methods effect it? Has anyone heard of a problem in Access that might cause this? Both printers are network printers. We have 10 users of the database as well as different versions of Access and Windows. Thanks for any help.
