Hello,

Is there some functionality that will allow an Access application when launched to automatically detect the screen area size, (ie 800 x 600 or 1024 x 768 etc...) and uniformly adjust itself to that size. Not paying attention to my dev settings and having recently developed an application in 1024 x 768 screen area, I installed in on a users workstation who has their settings at 800 x 600, thus enlarging the screens off the desktop area. The users eyesight is not good and unable to use the 1024 x 768 screen area settings.

Aside from manually resizing the application forms, I was wondering if there was some automation by way of procedure that can automatically detect and resize the application.

I know I should have just developed in 800 x 600.

Access 2000

Thank you for any assistance.
