Hi Jeff,

sorry if I did not make myself clear. I certainly know the difference between a spreadsheet and a relational database. :-)

I just need a form that presents records in a way that looks like I described. In fact its all about warehouse management and products with lots of attributes.

I worked on it thew last few hous and I created a form with two subforms, both related to the same table. Now I can see a record in both lists (each list containing half of the number of attributes a record consists of) and as long as I do not scroll in one of the two lists it looks good. If I could synchronize both lists, so that both scroll simultaneously, it would be great. Is this possible?

Regards,

Daniel
