Hi Pete!

Still trying to make it work as originally designed, I see!

Take a look at an Update Query in Access. You can use "Is Not Null" as a criterion to update (from) a field that holds a non-null value.

My original design suggestion still holds. A "summary table/record" may seem to help...

... but creating a "summary record" in a separate table only introduces the potential issue of synchronization. That is, you will have to ensure that: 1) new information to your first table gets properly recorded into the second; 2) any change to any row of information (old info, but modified) gets properly recorded into the second, summary table; 3) no changes are EVER made directly in the summary table, as this would cause it to fall out of synchronization with what is contained in your "details" table.

Good luck!

Jeff Boyce
