Of course it can be done, but where is the flight information coming from? Is it part of the form's recordset, or are we supposed to look it up somewhere? If so, where? Also, are you really using a text box called txtDirectFlight? If so, are you really using "Yes" and "No" as its vossible values? What happens if the dumb user enters something else? I think it would be better to use a CheckBox.
