The key question I have is: How do you capture the date that the database was opened the first time and then store this date in the database for future usage?

Tony

> *Where do you want to store it? If on your network create a table with computer name, UserId and date opened. Index all three fields with no duplicates. When opening the form on the remote pc's check to see if that machine has been entered in the table. if not, run an append query for that computername userid and date opened.*
