This is what I got

Inventory Form which shows employee name, extension, computer serial number and a checkbox for printer. When the checkbox is checked, a subform shows the printer's serial number.

I have the following code as an AfterUpdate event
PrinterControl.Visible = Me![CheckBoxName] = -1

Now, when I view a record and the checkbox is empty, the next record has the checkbox empty, but if I want to place a checkbox to show that employee has a printer, the previous record has the checkbox checked with the printer subform empty. If I uncheck the record and go back to the one that should be checked, I find the checkbox unchecked.

It was suggested I enter the code above in the Form's current event. How can I access the Form's current event, in order to place the code there? If needed... If there is another code all together, bring it on so I could try it. NOTE: I am not a pro at Access, rather just a beginner... Thank you for any and all help, in advance...
