Steve,

I didn't read your question correctly, and I thought i was answer another post (that's my 2nd problem on the project).

Like I mentioned on that post, I have a listbox (source is from a table only contains sample name), the user clicks on that listbox (it'll then query a different table for sample name), it returns the name, order#, Order ITem, and Qty. Therefore, Order# is known eventhough that's not displayed on the datasheet (the column is hidden). however, since it's a hidden column, the user cannot enter that value, as the result when new records are added into that table, that field becomes blank.

Thanks
