

Form linked to table but will not add data to table

I have one table and two forms.

The table is called orders and stores typical data you would expect to find.

The first form is called PreOrderDetails.

you use combo boxes to enter who you are, which site you are ordering for and which company you are ordering for. (a hidden orderID field set to autonumber also populates on this form) [This table is set to Data Entry only so it always opens with blank fields for the user to fill in]

Once you have entered these three bits of info you hit continue. This closes the preorder form and opens the main order form to the newest order record for you to enter the rest of the info (like what you want to order)

I just noticed that when you hit continue and the main order form opens, the info displayed is not the latest order. when I checked the table both forms are sourced to (orders table) it has not got any new orders added to it.

I've spent about two weeks working on this DB and its driving me insane, I'm sure this worked a couple of days ago when I tested, and as far as I know I hvae not changed anything to affect it but since it stopped working, I'm guessing I've done something.
Any help anyone can offer would be gratefully appreciated.

Dv
