Thank you for the quick response. It is almost working.

I forgot to mention that the ADD and EDIT command buttons open up a pop up form to either "add" or "edit/delete" a record. Where would I put code to move the focus from either command buttons on Form A (the main form) after I have closed the pop up forms?

Both of the pop up forms have a SAVE and CANCEL command button.

Thanks for your help. Cool idea about stacking the command buttons on top of each other.

Would this do it for you?

Run this code from the "After Update" action of the list box.

```
if isnull(listbox) or listbox = "" then
cmdAdd.Enabled = True
cmdEdit.Enabled = False
else
cmdAdd.Enabled = False
cmdEdit.Enabled = True
end if
```

As a suggestion, I would put both command buttons on top of each other and then in the code above substitute "Visible" for "Enabled". The way they would only see the button that is appropriate for the situation.

Form A has an unbound list box based on a query. When the list box has a record in it I want a command button called ADD to be disabled and a command button called EDIT to be enabled.

When there isn't a record in the list box I would like the ADD command button to be enabled and the EDIT command button to be disabled.
