The .LNK extension is the extension for a shortcut. Judging by the filename, I'd guess that the shortcut points to a different file location.

I am shipping an AccessXP runtime application that uses both mde and mdb files. One of my customers is reporting an error when they click the startup icon...

Windows can not run this file error, the file is RUNACC~1.LNK

I suspect malware may be at work, but a dump of the properties->target field doesn't show anything weird. Has anyone else encountered this sort of problem in the past? If so, how did you fix it?

Thanks!
