Spowler,

The (ex. name) CreditUsed control is "unbound" to any field, so it will show the same value on all records.

Since it seems as though your using the CreditUsed value as an element in a calculation, (or logic decision) you should be able to just add a CreditUsed field to the same table as the subform is based on... and store the value. Once "bound"... each record can have it's own CreditUsed.

I am very close but missing a piece on my database. I am creating a professional growth database. It has two tables. Employees (basics) and PG

(courses taken), In the courses taken I have credit hours, credits, enrichment, and enrichment hours, as well as the course information.

I have a form for entering data information. The tables are linked by the PG ID. I have added a subform that has all the courses listed that an employee has taken.

I then added a subform that totaled the credits in a query. I decided to add fields that show which were used "credits used", "credit hours used", etc. Then I added a calculated field that subtracted the credits used from the sum and leaves a balance. I then added an increment field and a calculated field that multiplies the increment by \$35.

Here's the problem, when I enter the credits used increments, it enters the same information for all employees. Should I create a third table called

Re: Subform calculation issue

Credit and link them to the employee by ID? Should I just add these fields to the employee table? Any suggestions? It looks good, seems right, but somehow it is not linked to an employee.

Thank you.
