Hi –

I'm a little vague on the details, but I had the exact same problem a couple of years ago (i.e. modifying reports), and it turned out to be a .dll conflict between MS Access and another running process or application (darned if I can remember which), and once I stopped that process, MS Access worked fine.

When MS Access crashes, do you get any indication of the cause at all, such as a .dll problem? If so, check to see if you are now running an application which you were not running before.

If I can retrieve the application name from my memory archives, I'll let you know!

Hi,

I have suddenly started experiencing a very strange phenomenon.

If I edit a report and change anything in it, when I click on save, Access shuts down completely without saving the changes !

I have tried all of the various compact and repair scenarios, I've created a blank database and imported all my items into it – with no success, finally I've uninstalled and re-installed access again with no success.

This is driving me nuts !!!!!!!

Regards,  
Paul
