Okay, let's check we are talking about the same thing.

"Subform" is a special term in Access, referring to a form that is within another form. When you open the main form, the subform opens in it. When you talk about "opening a subform", this is actually a completely different form, opening in its own window, is it?

Pass the code the wizard created for you for the Click event procedure of your command button. And please tell us the data type of the fields used in the expression; that is, if you open your table in design view, is it a Text field? a Number field? a Date/Time field? ...?

i have checked both forms [primary and detail] and the property setting for " filter on load " is set to " no "..

using access 2003, i used the command button wizard to create the link from my primary form to a detail form. i used the check box " open form with specific records " and then selected a field from primary form and a field from detail form . the field names were the same and used the match button < > to link the two fields.

i select a specific record in the primary form and when clicking the command button, it opened the sub form with only those records matching the linked fields.

however using the exact same procedure, access 2007 opens all records in the sub form. the only differences that im aware of is that access 2003 uses event procedure and 2007 uses an embedded macro. since all the coding is automatically generated, and not edited by me, im not sure what is happening.

i have tried this on several different databases using access 2007 and all

Re: The command button on my forms doesn't work, any clues why?

Re: The command button on my forms doesn't work, any clues why?
attempts have failed
all my data files have been placed in a trusted file location

Mike, it's not clear how you are approaching this.

Forms in Access 2007 have a FilterOnLoad property.
Set this to No. If it's set to Yes, it may load with an old filter applied,
so the record you want is not in the form.

Let us know if that makes a difference. If not, provide more detail on how
you are passing the value from one to the other.
