Michael, since it works fine on one machine but not on the other, you are looking to pin down the difference.

Is there any chance that one machine has had Office 2003 Service Pack 3 applied? There were some bugs introduced by SP3 for Office 2003, including combo display problems:

<http://allenbrowne.com/bug-Access2003SP3.html>

If that's the issue, the hotfix (last link in the short web page above) might solve it.

I use a list box to display query results for record searches. The underlying query uses two tables. It has worked fine for years. All of a sudden, the columns from one of the tables is not displaying in the list box, but if I run the query in the query window, all the columns return data. I have not made any changes to the table or form or list box used in this process. It literally just started happening today.

The list box displays fine on one of my boxes but not the other (both XP Pro; Access 2003). I delivered a new front-end to a client this morning and he alerted me the anomaly. I restored his previous front-end and the list box displayed fine. However, I downloaded the exact same front-end that is working fine on his box (XP Pro, Access 2000) and that is the one that works on one of my boxes but not the other.

Am I just going crazy or has anyone ever experienced this before? I have not been able to find any online documentation referring to this error. Any help is appreciated.

Thanks.
