Hi Andy,

I presume that copying and pasting did not quite do it? If so, check the original button's on click event. Click in the On Click line and then on the little ... button to see the coding associated with the button. Copy that coding to your copied button's on click event.

Hope that helps,

Clifford Bass

I am using the Contact management database and I am trying to set up a new form and want to use the map button they have on one of the standard forms provided in a new form. The map button will display directions and a satilight map to the address from the address field.

How do I copy this from one form to another? I think it is an imbedded macro or visual basic deal.

Can someone help?

Thanks,  
Andy
