I can only comment generally.

The error message stating "no more databases can be opened" is not what it seems; it does not literally mean databases! This error message arises when Access stops processing due to complexity issues in the design of your database.

The issues are:

1. too many calls for data from the same data source (usually tables)
2. too many calls for data in all open objects such as queries, SQL, domain aggregate functions, etc.

My bet is that you have exceeded issue 2.
