Sounds like you want a combo box to display contents based on the entry in a previously selected combobox? If that is true, do a search for "cascading combo" box. This has been asked and answered countless times in these newsgroups.

Hi,

I am very NEW to Access but an Oracle Developer for the past 10 years. What I am trying to do is build a query screen to get parameters to send to a report. I have an ID that is made of three separate fields (Year,Number, Sequence). I have built combo box for the year and pull the distinct year from the table. I have built another comb box for the number but can't figure out how to have it just pull up the numbers that correspond for that year. If anyone is an Oracle programmer this would be the same as building a LOV for the Number field with this select as the record group query:

```
Select Number
from table_name
where year=block.year
```

I would do this all as non-base table (I think this is the same as unbounded) as I am only wanting to get the criteria not update the table and then build the where_clause to send to a report.

I want to do the same for sequence, pull the sequence numbers in a combo box for the year AND number. I can just write the select stmt if I can figure out the right syntax.

microsoft.public.access.formscoding: Re: Query Form

Thanks,

Toni
