That is what the test database does: Deleting all records from the recordset. And my proposed fix was to call MoveFirst on the empty Recordset to update BOF and EOF to true.

Searching the help files and MSDN I only found the stuff about Requery being equivalent to Close and Open and therefore concluded that BOF and EOF should be set to true. Do you remember where you read about BOF and EOF should be false? I understand your point with Move actions. However in my opinion the help files seem to contradict Access regarding Requery. It would be nice to hear the opinion of someone from the Microsoft Access team.
