My application has a summary table and two detail tables, with one-to-one relationships between the summary table and the detail tables. In the summary table I have a button to go to the detail table. Code behind the button opens the correct record in the correct detail table or asks to create a new record. Below is the code to create a new record in one of the detail tables – it "works" (displays the correct data in a new record), but I am not allowed to save the data. It says that I have a duplicate value in an index.

```
If MsgBox("No Tracking Record Found. Create a New
One?", vbOKCancel) = vbOK Then
    DoCmd.OpenForm "frmCTrackGenInfoDE", acNormal, , ,
acFormAdd
    Me.[Grant#] = [Forms]![frmGrantSumDE].[Grant#]
    Forms![frmCTrackGenInfoDE].[Grantee] = [Forms]!
[frmGrantSumDE].[Grantee]
    Else
    MsgBox ("Action Canceled")
    End If
```

Note, that if I create a detail record that is not linked to a record in the summary table, it saves fine. Grant# is the key in all tables. I'm unsure if I need to focus on the coding, bound fields or the original query to resolve this problem.

Thanks for any help you can provide.

Lloyd
