When I add the name of a new individual in a, bound form, it will not display that person s name in a label control of a second unbound form.

I have a scheduling program that I am working on. Included in the application program is a data GRID . Its purpose is to display the results of a range of from-to-dates of registrations for different clients. The difficulty that I am having is in displaying new registrant names in a display label of a second form when it s GRID is immediately accessed via a command button. The display label works just fine for existing entries that came with the data GRID module that I previously purchased. It s just when I try to add NEW entries that I the label control will not work/refresh. However, other than the names of new entries not appearing in the label control, the range of start to end-date for these entries, created in the first form, does display in the GRID of the second form.

The following is a description of how everything is supposed to work:

I have three forms; two with tables and one (unbound) display form:

1. Form: frmGuest (label name: fsubGuest)

Table: tblGuest

Field: GuestID (label name: cboGuestID) which holds the registered name

This form is used to create individual records/accounts for future registrations and list past Registrations.

2. Form: frmStatus

Table: tblstatus

Form is used to create registration schedules for individuals pulled from the above form, frmGuest and table, tblGuest . You normally would select a name from a combo box on this, frmStatus , form along with selecting the appropriate start and end-dates.

This form contains a command button for accessing the data Grid for viewing

Label will not display NEW records frm another (bound) form.

results of the date range for an appointment just created. .

When you press a command button, you are immediately taken to the scheduling data Grid (frmMain).

Whatever name you had selected before pressing the command button, above, will now appear in the, label control, lblCurrStat on the, frmMain form below along with the corresponding date in the Grid.

3. Form: frmMain

Table: unbound

Form is used to display registrations, made from the form, frmStatus , in a GRID.

The form, frmMain contains the label control, lblCurrStat that displays the name of an individual selected in the, frmStatus form along with a couple of other pieces of information.

Again, all the above will work, except ONLY WITH EXISTING registrations, but not new ones. When you add the name of a new individual in the form (along with a couple of pieces of information), frmGuest and table, tblGuest described above, it will not display that person s name in the label control, lblCurrStat located on the, frmMain form. However, the date range for the registration does show up in the data GRID of the same form.

Here is a portion of the Module, "basGrid" that I use to reference the label control, "lblCurrStat" located on the, frmMain Grid form that is supposed to be refreshed with the registrants name and other information:

With frmS

```
frmM!lblCurrStat.Caption = !cboGuestID.Column(1) & vbCrLf & _  
!cboUnitID & vbCrLf & _  
!cboStatusType.Column(1)  
End With  
ExitLine:  
Exit Sub  
End Sub
```

.
