That either indicates that you have some code running, or else that the code is corrupt.

1. Close the database.
2. Start Access again, holding down the Shift key if you have anything that automatically starts when you load.
3. Uncheck the boxes under:
Tools | Options | General | Name AutoCorrect
Explanation of why:
<http://allenbrowne.com/bug-03.html>
4. Compact the database:
Tools | Database Utilities | Compact/Repair
5. Close Access. Make a backup copy of the file. Decompile the database by entering something like this at the command prompt while Access is not running. It is all one line, and include the quotes:
"c:\Program Files\Microsoft office\office\msaccess.exe" /decompile
"c:\MyPath\MyDatabase.mdb"
6. Open Access (holding down the Shift key if you have any startup code), and compact again.
7. Open a code window.
Choose References from the Tools menu.
Uncheck any references you do not need.
For a list of the ones you typically need in your version of Access, see:
<http://allenbrowne.com/ser-38.html>
8. Still in the code window, choose Compile from the Debug menu.
Fix any errors, and repeat until it compiles okay.

At this point, you should have a database where the name-autocorrect errors are gone, the indexes are repaired, inconsistencies between the text- and compiled-versions of the code are fixed, reference ambiguities are resolved, and the code syntax is compilable.

Re: Module Not Found

If it is still a problem, the next step would be to get Access to rebuild the database for you. Follow the steps for the first symptom in this article:

Recovering from Corruption

When I do the compile, it doesn't show me what is wrong just gives me the error messages "You canceled the previous operations" and "Module Not Found"

It's not showing me where the error is occurring

"Allen Browne" wrote:

There is something else wrong here.

In the code window, choose Compile on the Debug menu.

Fix any issue that Access highlights.

Repeat until the code compiles okay.

"WMorsberger" <WMorsberger@xxxxxxxxxxxxxxxxxxxxxxxxxxxx> wrote in message news:B9C5CCB6-98FF-44BD-9627-91FE502883B4@xxxxxxxxxxxxxxxxxxxx

I added the following:

```
Private Sub cmdCancel_Click()  
Stop  
If Me.Dirty Then  
Me.Undo  
End If  
DoCmd.Close acForm, Me.frmReroutes_Report_By_Contact  
DoCmd.Close acForm, "frmReroutes_Report_By_Contact"  
End Sub
```

and when I try to press the button I now get this error:

The expression On Click you entered as the event property setting produced the following error: Invalid outside procedure

Re: Module Not Found

"Allen Browne" wrote:

The 4 lines of code go into the event procedure for your command button, instead of the 1 line in your original post.

The error message could be related to something else that is going on, e.g. another event that is still running (such as the Exit of another control, before Access moves focus to the button and starts processing its Click event.) To test that idea, add this line above the other 4:
Stop

Now when it runs, if Access stops on the line, you know the event is working. You can then press F8 to single-step through the procedure and see where the problem lies.

where exactly am I putting that - I opened up VB going through the cancel button that I was having the problem with. When i tried to type it up I still kept getting the error message "You canceled the previous operation" Because I am really new at this I don't have a clue :) This is

Re: Module Not Found

what I
was
typing

```
If Me.Dirty Then
Me.Undo
End If
DoCmd.Close acForm,
Me.frmReroutes_Report_By
Contact
```

"Allen Browne" wrote:

Something
has gone
wrong with
the naming,
or there is
some other
operation
in progress.

Try undoing
whatever is
happening,
and use the
name that
Access
knows
the
form by:
If Me.Dirty
Then
Me.Undo
End If
DoCmd.Close
acForm,
Me.Name

I
have
written
code

Re: Module Not Found

for
a
cancel
button
that
I
have
on
my
form
–
when
I
close
VB
and
press
the
cancel
button
I
receive
the
error
message
"Module
Not
Found"

Here
is
the
code
that
i
have
for
the
cancel
button

```
Private  
Sub  
cmdCancel_Click()  
DoCmd.Close  
acForm,  
"frmReroutes_Report_By_Contact"  
End  
Sub
```

Re: Module Not Found

Now
when
i
was
typing
the
code
in
instead
of
getting
the
options
boxes,
example,
when
I
typed
DoCmd.
I
got
an
error
message
stating
"You
canceled
the
previous
operation"
