Compress/Repair didn't change anything (had already done this)

Debug immediately returned: Invalid Call Procedure or Argument

Did not scroll thru any code or anything, just immediately popped that message up. I was at the opening Form – had changed it to DesignView and then selected Code

Not sure I am going to be able to take the time to import everything into a new container as I don't really own the application and am just adding a Form. Also, as originally stated – I don't think the problem exists on owner's desktop. Still – would welcome advice on resolving the debug....at least to better understand the situation.

Ah... sometimes that can happen... Couple of things to try:

1. Compact and repair your database; if that doesn't work
2. Try creating a new (blank) mdb file and importing all the items from your existing database...

Also, open a code window and click debug->compile. This will stop on code that has syntactical problems (although I don't think this is the case in this instance – just for future knowledge).

There is a Macro named AutoExec – looking at it in designview just seems to open Form Main – – nothing to do with XYZ

RE: Form loading error

Looked at Tools/StartUp and nothing seems related to form XYZ...it also shows Form Main....

New Info; I just noticed that I get the same error message when I close the mdb also. This time I selected "no" to the prompt and it returned this message:

The VBA project in the database is corrupt

Hi NTC,

Check the startup properties of the database to see what's being loaded...
also check for the existence of (gag) an Autoexec macro...
this will be a
good start...

To bypass all startup stuff, you can hold the shift key down while opening the database.

Hope this helps.

In opening an Access2000 .mdb -- that I brought over to my own desktop using my flash drive -- I am receiving the error message:

An error occurred while loading Form_FrmXYZ. Do you want to continue loading the Project?

This Form (XYZ) is not the switchboard nor is it set to auto open.

So my question is as to what is meant by "loading".

(Just some other info; I am only doing a simple thing of adding a new Form

RE: Form loading error

and don't know the whole application – I was told they import/download alot of info from their web store daily – – – so my hunch is maybe there is a link to this exterior web site which maybe is triggering the error message – – but that is a guess.)

The Form XYZ seems to work fine otherwise.....at least it opens fine....and I see no procedures in the Form's Event properties.

Since I don't think this error occurs on the owner's machine – it isn't something I seek to fix per se – – just trying to better understand this idea of it "loading" and where to look in VBA to see more info....thanx
