Hello All

I have a small problem with a MS Access developed in VBA.

The programme is developed as queries on the run using SQL.

I have a number of private forms which are bought together in a global form.

Every thing is OK if I generate a report with the complete database, but if I select parts of the to selectively sorted database it is calling for parameters, using the filter.

The code line on the global form with the following command appears as follows:

```
Set rst = db.OpenRecordset(marSQL, dbOpenDynaset)
```

The set rst command shows rst = nothing and the dbOpenDynaset command = 2

These notations appears in the debug mode.

I was wondering if you could help me.

I have completed a number of these programmes in the past without any problems but now this problem is coming to light.

Regards

Alan Dunn
