Bob,
Your suggestion was the one I followed. These little tidbits are always worth remembering, sort of like when one has invisible controls on a report so that the query fields can be referenced in code.
Thanks,
Bill

An explanatory comment in the form's code module helps remember particiularities of implementation.

I need to set a command button's visibility to FALSE when it receives the focus.

No, you need to set the button's visibility to False, AFTER it

Re: Focus Issue

has

received focus and done something, because the code under the

button

won't ever get executed if you make it not visible during the OnGetFocus Event.

So, I first

need to move the focus to some innocuous control, most desirably the form itself. I've tried Me.Form.SetFocus, but that doesn't seem to have any affect. What's the expression to move the focus to the form?

The form cannot receive focus if there is any control on the form which can get focus. One workaround is an empty textbox, in the upper left corner of the form, with 0 width and 0 height.

Thanks,
Bill
