My form uses three underlying tables: Classes, Students and a linking table called StudentClassRegistrations, which stores the primary key for the student and the class. I want to add a record to StudentClassRegistrations based on the values selected in the form s two combo boxes (The form s recordsource is set to Classes).

The first combo box allows the user to select a class (after which a subform displays all students enrolled in that class.)

The second combo box allows the user to select the student to enroll.

I want to build an `Enroll Selected Student` command button that adds a record to StudentClassesRegistrations, but have no idea how to accomplish this via code. Any help will be enormously appreciated.
