I need some advice. From an Access table (2003), I want to pull up certain records, email them (could be 30 records with 20 fields) to salsemen. They will receive the data and have the opportunity to enter data, check checkboxes, select from combo boxes, and then e-mail the data (after its changed) to the originating computer where it will go back into the Access database. Can it be done with Access? What are some of the steps and techniques I would have to incorporate?

Thanks for your guidance. I know it can be done, but i don't have a clue how to accomplish it.

.
