The dlookup can return only one value, to return more than one value it is better to use Open recordset then running few dlookup, that way you access the record only once and get all the values

But in the dlookup you can perform filter on more than one field
dlookup("FieldName","TableName", "FieldNumber = 1 And FieldText = 'aa')
You can also filter on parameters
dlookup("FieldName","TableName", "FieldNumber = " & Param1 & " And FieldText = " & Param2 & ")
