

Re: Compile Error

```
stDocName = "rptDepartmentSeniority"  
DoCmd.OpenReport stDocName, acPreview
```

```
Exit_btnDepartmentSeniority_Click:  
Exit Sub
```

```
Err_btnDepartmentSeniority_Click:  
MsgBox Err.Description  
Resume Exit_btnDepartmentSeniority_Click
```

```
End Sub
```

compare each line of the above code with your original code, so you can see exactly what changes i made, and where. there's a consistent pattern there that should be easy to pick up on.

btw, don't feel bad about being intimidated by VBA – you're not alone. when i took a VBA class after using Access macros exclusively for two years, i thought i was going to have a heart attack from the stress – i had a TERRIBLE time trying to understand the basics. but i just forced myself to quit using macros (cold turkey) and do everything in VBA, and gradually it began to make sense and got easier. trust me – once you get the hang of VBA, you'll love all the things you can accomplish with it, stuff you could never dream of doing with macros! so hang in there! :)

Hi,

Using Access 2000 and I guess it's time to really try to understand VB. I do have the book Beginning VB for Access 2000 but the thickness of the book

intimidates me and forces me to just leave it on the shelf. Well, I think

I

have learned all I can by trial and error and clicking around to see what happens and I don't know the vb terms well enough to search for exactly

Re: Compile Error

what

my problem is. I will be picking it up pretty soon but before I do, I

was

wondering what the error message below is telling me? This code was

created

by the program when I used the wizard to make a command button on a form

to

open a report. The button works but after someone told me that I should debug compile and save anytime I insert code (maybe they meant when I made

it myself instead of using a wizard?) I decided to look at the properties

of all my buttons and do this. When I clicked on debug/compile, I got

this

message.....Thanks Linda

Compile error: Label not defined.

The cursor jumps to the following line...

On Error GoTo Err_btnDepartmentSeniority_Click

This is the whole subroutine...Is this a subroutine or a module or what?

```
Private Sub btnDepartmentSeniority_Click()  
On Error GoTo Err_btnDepartmentSeniority_Click
```

```
Dim stDocName As String
```

```
stDocName = "rptDepartmentSeniority"  
DoCmd.OpenReport stDocName, acPreview
```

```
Exit_btnDepartmentVTO_Click:  
Exit Sub
```

```
Err_btnDepartmentVTO_Click:  
MsgBox Err.Description  
Resume Exit_btnDepartmentVTO_Click
```

```
End Sub
```
