Hi everybody,

I solved the problem I had yesterday and I am bothering you again (I hope it will be the last time for a while!).

I have a form listing orders + subform listing products for the same order.

When I enter the order in the form I have a listbox for selecting the number of different products the customer is buying (I don't need to record how many copies of the same products I am selling, just how many different products – don't ask me why, it was not my idea!)

Something like FlowersListbox and

- 1) rose
- 2) daffodil
- 3) daisy
- 4) lily

I have a row for each product and the number of rows has to match the number I enter in the main form in the listbox:

So if I select 4 in the FlowersListbox I must have 4 different kind of flowers listed in the subform.

The products are inserted manually. After I finish inserting them I have a button which locks the subform and prevents any editing. I also want to perform the check whenever I activate the button.

The button is on the mainform.

Is it possible to do anything like this?

Thanks

Erika
