However I am trying to put in a suform for a many-to-many relationship table into a form for one of its relationships (ie the product). What I want to happen is that when filling out the product information (main form), the product combo box control on the main form is linked to the product combo box control on the sub form so that when filling out information the many-to-many relationship is automatically updated.

You don't need, and shouldn't have, a control bound to the ProductID on the subform. Instead, use the ProductID as the subform's Master and Child Link Field – it will automatically fill in the current productID from the mainform.
