John I got it to work with the code below I got from an example I found. I would also like to add an outlook window with my email address so they can email me. I posted this question in the new users so it wouldnt get mixed up with this one. Please look at it because I havent a clue on how to go about implimenting this... Thanks!

```
Private Sub Form_Open(Cancel As Integer)
```

```
Dim db As DAO.Database  
Dim rst As DAO.Recordset  
Dim rstV As Recordset  
Dim stDocName As String  
Dim stLinkCriteria As String
```

```
Set db = CurrentDb()  
Set rst = db.OpenRecordset("tbl_LoginID", dbOpenDynaset)
```

```
If Not IsNull(Me.Text_Network_User) Then  
rst.FindFirst "strEmployeeUserID = " & Me.Text_Network_User & "" &  
" And strEmployeeUserID = " & Me.Text_Network_User & ""
```

```
If rst.NoMatch Then  
MsgBox "You do not have access to this database!!! " & Chr(13) & _  
"Please contact the Database Adminstrator for assistance.",  
vbOKOnly + vbCritical, "Logon Denied"  
DoCmd.Quit
```

```
Else
```

```
stDocName = "WelcomeForm"  
DoCmd.OpenForm stDocName, , , stLinkCriteria
```

```
End If
```

```
End If
```

```
End Sub
```

"John Spencer" wrote:

Probably because you copied it and it was wrapped into multiple lines by the newsreader. Plus Klaatu missed a closing parentheses.

```
If IsNull(DLookup("[loginID]", _  
"[tbl_LoginID]", _  
"[loginID] = "" & Me.Text_Network_User & """)) Then  
MsgBox "You are Not Authorized to Live on This Planet"  
End If
```

Although my preference is this situation is to use DCount instead of DLookup.

```
If DCount("*", "tblLoginID", "LoginID = "" & Me.Text_Network_User & """) = 0  
Then  
MsgBox "Go home. You are wanted here."  
End If
```

The above should be three lines of code. The first line starts with "IF" and ends with "Then"

I forgot to mention I cant even ener this code it gives me a error

Compile error:  
Expected: expression

Me.Text_Network_User & """) Then
```

Re: Permission to open database

MsgBox "You are Not Authorized to Live on This Planet"  
End If

Hello, I want to be able to check the users  
PC login name on a  
"WelcomeForm"  
against a field named loginID with names  
and if the users PC login name  
isnt  
in the list in the table "tbl\_LoginID" then  
they get a message stating  
they  
do not have access to the database and the  
database closes. I already  
have a  
"WelcomeForm" startup form that shows the  
users login name by using a  
test  
box named Text\_Network\_User and its  
default value =FOSUserName() and a  
module  
that gets the users login name andputs it in  
the Text\_Network\_User .  
That  
works great! my problem is I want to run  
code on the "WelcomeForm" on  
open  
event that would check the name thats in the  
Text\_Network\_User text box  
and  
if its not in the tbl\_LoginID field- LoginID  
then it closes the  
database.  
Here is what I have so far and it keeps  
closing the database... Im a  
newbie  
so please expalin... Thanks!

```
Private Sub Form_Open(Cancel As Integer)
'Check value of password in tblEmployees to
see if this matches value
chosen
in combo box
```

```
If Me.Text_Network_User.Value =
```

Re: Permission to open database

```
DLookup("LoginID", "tbl_LoginID")  
Then
```

```
LoginID = Me.Text_Network_User.Value
```

```
'Close logon form and open Welcome screen
```

```
DoCmd.OpenForm "WelcomeForm"
```

```
Else  
MsgBox "Access Denied", vbOKOnly,  
"Invalid Entry!"  
End If  
Application.Quit  
End Sub
```
