Ciao

sorry for my language-horror

I have a problem on my program developed on Access2003 .

It as composed two forms (Mask1 and Mask2 both popup and dialog edge) and reports .

Start Mask1 and click the button that it open Mask2 overlapped

Mask1(mask1 is visible under Mask2) . On Mask2 there are any push-button for as many reports.

When click one show the correspondent report and hide forms Mask1 and Mask2. When I close or print the report i would have to the Mask2 over Mask1

on click push-button on Mask2-----
Docmd.openReport "MyReport"
forms!Mask1.visible=false
forms!Mask2.visible=false

I control the report and close or print it

On report-close :
forms!Mask1.visible=true
forms!Mask2.visible=true

It will be strange but Mask1 is visible and Mask2 is not visible
I have controlled the code in debug but even if the line
forms!Mask2.visible=true is processed (no error) the state
visible=true it is not executed the Mask2 is hide and loaded, i
see only Mask1 ... mistery because some days before it worked normally
Ideas in purpose?
Thanks
Natan- Italy
