You write a series of queries that delete data from each table.  
Delete the records in any child tables before you delete the records in any parent tables.

I want to develop a database and test it with test data.

How do I empty the database of the test data when I've finished testing  
and  
want to enter real data?

In Paradox it was easy and obvious, but in Access I haven't been able to  
find  
it.
