I am exporting data from ACCESS database to EXCEL. The datasource is a query.

There are numeric fields in the query but after exporting, the numeric data type is changed to text.

How do I change the data type of the EXCEL columns before exporting.

I'm using the following statement after loading the data into an array.

```
oSheet.Range("A2").Resize(irows, icol).Value = vArray  
vArray is defined as variant.
```
