Well yeah, but currently all my stuff is for myself (I'm self-employed.)

I used to do this too. But what happens if the query pukes and causes an error where you're presented with the good ol' "Debug or End" prompt? It would be good to have some basic error handling in place to set the warnings back to true in the event of an error. But, I'm sure we all have at least some rudimentary error-handlers in each procedure. :-)

"David C. Holley" <[DavidCHolley@xxxxxxxxxxxxx](mailto:DavidCHolley@xxxxxxxxxxxxx)> wrote in message [news:OtgahzGRFHA.2356@xxxxxxxxxxxxxxxxxxxxxxxxxxxxx](mailto:news:OtgahzGRFHA.2356@xxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

```
DoCmd.SetWarnings False
DoCmd.RunSQL (or DoCmd.OpenQuery)
DoCmd.SetWarnings True
```

I'm in the habit of encapsulating the query to ensure that the warnings are always turned back on afterward as there are times that I want to see them, esp If I'm developing something or if theres the possibility that the user may run a query.

```
I have sql in vba that does update and
deletes..when they trigger a prompt
asking the user if they want to
```

Re: Delete/Update prompts

delete/update the table appears...How can I stop that from happening and just have the statement go through?

thanks
