Yes, I understand that the debugger must be running to show the variables. I have set a break point but it does not stop there. F8 does not work. I cannot add anything to the watch window.

i think what might be happening is that when I go to the "display the page on the web" a pop-up window comes up about the information bar and it blocks the execution of the rest of the page. I have tried and tried through the help given with these windows/bars and through all of my internet security settings to make that pop up window stop happening but nothing I do stops it. i have completely turned off my norton anti-virus program and the internet security program and still the pop-up window comes. When the debugger brings up the web page, it doesn't show the pop-up window so I cannot close it at that point and I cannot proceed with the debugging to get to my break point.

Can you help me?
