When I attempted to reproduce the problem before, I mistakenly used a table that didn't have any text or ntext fields. When I use a table that does, I can reproduce the error ...

```
Set db = CurrentDb
Set rst = db.OpenRecordset("SELECT * FROM dbo_Employees", ,
dbSeeChanges)
Debug.Print rst.Fields(0).Value
rst.Close
```

This causes the 'must use dbSeeChanges' error, even though I am already using it. However, explicitly specifying dbOpenDynaset did fix the problem for me ...

```
Set db = CurrentDb
Set rst = db.OpenRecordset("SELECT * FROM dbo_Employees", _
dbOpenDynaset, dbSeeChanges)
Debug.Print rst.Fields(0).Value
rst.Close
```

The above ran without error. I tested both with the SQL statement as above, and using the table name, with the same result.
