Hi,

it is not a good idea to do this from VBA, if you don't have controls installed, and your project has references to these controls – then VBA most likely fail

You have to register these controls during setup, or ask users to register using regsvr32.exe

Hi,

I've developed an application with some activex control. Not all users have this control installed / registered on their system. How can I check with some VBA code if the control is available (see the list in the window Tools > ActiveX Controls), and, when not, to register it? (i.o.w the proces that happens when the button Register is pressed)

Thanks in advance,

Regards,

Henk
