This is from Access Help

OLE Object Properties Example

The following example creates a linked OLE object using an unbound object frame named OLE1 and sizes the control to display the object's entire contents when the user clicks a command button.

```
Sub Command1_Click
OLE1.Class = "Excel.Sheet" ' Set class name.
' Specify type of object.
OLE1.OLETypeAllowed = acOLELinked
' Specify source file.
OLE1.SourceDoc = "C:\Excel\Oletext.xls"
' Specify data to create link to.
OLE1.SourceItem = "R1C1:R5C5"
' Create linked object.
OLE1.Action = acOLECreateLink
' Adjust control size.
OLE1.SizeMode = acOLESizeZoom
End Sub
```

I would use:

```
Private Sub YourButton_Click
OLE1.OLETypeAllowed = acOLELinked
OLE1.SourceDoc = "C:\YourPic.BMP"
OLE1.Action = acOLECreateLink
End Sub
```

Done!

.
