I'm exporting data from an Access query to an Excel spreadsheet. I have no control over the order of the fields in the query and would like to be able to use code to move and resize some of the columns in the Excel Spreadsheet after the export. I'm already using code to format the column headers and change the font in the body, but I can't seem to find any references to moving columns or to adjusting column widths. Any help will be very much appreciated.

Bob Boyden
