All,

I was wondering if someone might be able to help me with how to properly reset a required date field after you've moved on to a subsequent fields.

By that I mean if you have six fields on a form:

Field1 – Memo Field  
Field2 – required – Text field  
Field3 – required – Date field  
Field4 – Text field  
Field5 – Text field  
Field6 – Text field

When a user Enters Field4 I want to validate with the user that indeed the data entered in Fields 1–3 is correct. After they make an affirmative response I disable and lock Fields 1–3.

The problem that I am running into is I can't seem to figure out how to change the date field back to a Null state and variations of `me.Field3.value = ""` will throw an error unless I immediately assign a new date such as `me.Field3.value = "1/1/1900"`.

Field2 is easy to figure out how to Foo–Reset, I can just use `me.Field2.value = ""` but how would you do the equivalent with a Date field?

I know that I could just totally reset the form but I would prefer to just reset the required Field2 & Field3 and then set focus back to Field2.

Thanks in advance. – CES
